What's a CD?

DM me at brickingitrn on discord if you have questions/ criticisms

(Mouse and Keyboard, and partially controller guide, execution on mobile is more difficult and gimmicky, resources for that on the final page)

A CD refers to a "priming" charged attack having a dash take place before it comes out, and immediately after, the dash is canceled by the charged attack, it looks like this:
(priming means the input has been/ is being done, but it hasn't been long enough for a charged attack to occur).

You're probably familiar with the notation CCDCDCF 2(CDCDCF), because this is a notation for the game Genshin Impact, it makes absolutely zero sense without a proper breakdown.

The first set of actions starts with CCD and not CD as it is more damage for practically free.

[CHARGED ATTACK > CHARGED ATTACK > DASH]
(don't rush the dash, the second charged attack needs a bit of time to startup and if you hit dash too soon the CD will come out very clunky, feel out the timing) thanks Golden

It's worth noting that the timing of these is really quite lenient, the only completely essential part is to make sure your SECOND charged attack is input during the period in which your FIRST charged attack is too early in its animation to be ended by releasing (doing a finisher).

This area is roughly how much space you have to input the second charged attack, exceeding that line while not holding down a charged attack will lead into a finisher.

Once you've learned how to CD, you need to chain 2 of them together in quick succession, note that the input for this is what will be used on every utilization of the tech EXCLUDING the very first CCD, here's a video explaining how you do that: (thank you to NovaMaka for explaining this back when it made absolutely 0 sense).
[The input for CD is as it seems, CHARGED ATTACK > DASH, but you should remember that this MUST be executed during an ongoing animation (finisher or charged attack), and you must keep the charged attack held down immediately after doing a CD to not go into a finisher]
This is what a CDCD(CF) looks like, focus on the repeated CDCD part.

After the learning curve, you get to relax (kind of), for the proper mono damage (mono pyro, overload) combo, you wait out the dash cooldown that CDCD gives you by doing a normal CHARGED ATTACK, then releasing the moment

that CHARGED ATTACK touches the enemy, this will obviously lead into a FINISHER.

Now for a slightly confusing bit, canceling OUT of a FINISHER (the big swing she does when you let go of a charged attack).
To explain it as simply as possible, the FINISHER animation behaves exactly the same as the ONGOING CHARGED ATTACK animation behaves, you do the CD input and the FINISHER immediately leads into a CHARGED ATTACK, and from that CHARGED ATTACK, you can CD again, giving you the overall actions of CCDCDF->CDCDCF.
The FINISHER acts the same way the first C in CCDCDCF does, removing the need to start with a CHARGED ATTACK and letting you smoothly connect the combo.
String all this info together to execute, CCDCDCF 2(CDCDCF)

The better your execution is, the more likely you are to get every single hit in Mavuika's burst duration, you need lots of practice to consistently do that, and a frame unlocker helps.

Unfortunately, I feel somewhat obligated to address other combos at least briefly.

Her more carpal tunnel inducing combo, 7cdc (technically 9cdc, with 2 sets being outside of ult), or 13/14c, uses an additional bit of tech revolving around pressing the attack button twice quickly after each CD, which for some reason keeps her in her CHARGED ATTACK, this “handsfree” state then allows you to wait for a normal CHARGED ATTACK to connect, then you can input a CD to essentially loop that for the duration of the combo, almost doubling your CHARGED ATTACK count from something like simply holding down the CHARGED ATTACK button.

I do NOT recommend this combo for overload/ mono, it's noticeably worse, harder, way less cool, and a lot more irritating at times. The singular use case I would suggest is if the enemy had a permanent hydro or cryo aura, in that situation [7CDC] actually allows you to do a lot more damage than CCDCDF 2CDCDCF.
This is basically only useful for Herra or Tulpa.

Moving onto something more useful, there is another variant of Mavuika combos that mixes CDC and CDCDCF to create a combo that is easier than a perfect CCDCDCF 2CDCDCF, while only sacrificing a small amount of damage. The combo in question being [CDC 2CDCDCF CDCD(CF)].

Finally, the last actually important bit of information, the early burst startup tech. Essentially, if you begin to input a CHARGED ATTACK during the impact frame of Mavuika's burst, your first CHARGED ATTACK will start much faster than it otherwise would, this saves you important burst duration which can lead to a big bump in damage.
There's not much to explain here other than start holding CHARGED ATTACK at around this frame:

Go costbat your ol :)
